Education

University of Illinois Chicago Chicago, IL — August 2022 – Present
Ph.D., Physics

University of Washington Seattle, WA — September 2018 – June 2022
B.S., Comprehensive Physics

Awards

DOE Office of Science Graduate Student Research (SCGSR) Award – funds thesis research at a DOE national lab — 2027

URA Visiting Scholar – Universities Research Association award for research at Fermilab — 2026

Chicagoland Computational Traineeship in High Energy Particle Physics (C2 the P2) – two years of full PhD funding for work at Fermilab — 2023 – 2025

IRIS-HEP Fellowship – scientific computing software for the particle physics community — 2021

Washington Research Foundation Nanofabrication Fellowship – quantum computing research — 2019

Research Experience

Amazon Web Services, Fundamental AI Research New York, NY — May 2026 – Present
Applied Scientist Intern

- Research whether LLM agents can follow a wall-clock time budget on long-horizon tasks and use that time effectively, including time spent in tool calls and code execution that the model cannot measure from its own output
- Built time-budgeted evaluations in Factorio and Kaggle machine-learning competitions (MLE-bench) that measure deadline adherence, how much of the budget agents use, and whether they adapt their strategy to it
- Showed that agents meet deadlines but use only about a quarter of their budget; adding a live clock raised output 77% with no missed deadlines
- Developed an RL method (GRPO) that trains agents to follow the budget and adapt their strategy to its length, e.g. different Factorio strategies for short and long budgets
- Introduced trajectory grafting, a data-augmentation method that splices rollouts across budgets, nearly doubling output under long budgets on held-out tasks
- Modified the model architecture to encode elapsed time, raising on-time task completion from 6% to 50%
- Scaled training to multi-node GPU clusters with hundreds of parallel environments, including a 27B-parameter model trained across AWS regions
- First-author paper at the Resource-Aware Agentic AI Workshop @ NeurIPS 2026

Fermi National Accelerator Laboratory Batavia, IL — June 2023 – Present
Graduate Research Fellow

- Member and author of the CMS Collaboration at the CERN Large Hadron Collider
- Design efficient transformer architectures for real-time particle jet classification at the LHC trigger: a physics-inspired linear transformer that uses 80% less memory than full attention at matching accuracy, and a hierarchical patch-attention model with geometric message passing that reaches state-of-the-art accuracy among resource-constrained taggers (NeurIPS 2026)
- Mixture-of-experts particle transformers: showed that top-1 routing beats a dense baseline at the same forward compute on 188-class jet classification, and that stored capacity, active compute and routing organization must be evaluated separately
- Interpretability of jet taggers: traced near-binary attention in particle transformers to the attention mechanism rather than the physics-inspired interaction matrix; distilled the latent space of FPGA-deployable and transformer taggers into if-statements on jet physics quantities that reproduce the network's decisions on 94% of jets
- FPGA deployment of jet taggers for the CMS Level-1 trigger: quantization-aware training (HGQ2) and high-level synthesis via hls4ml and distributed arithmetic (da4ml) to bit-exact RTL; a 64-particle PHAT-JeT design runs at 96.6 ns within 10% of a VU13P. Hardware-aware neural architecture search with surrogate resource models (AutoML 2026); quantized recurrent networks with hls4ml
- Trained transformer and mixture-of-experts models on 100-million-particle datasets with distributed training on GPU nodes at Argonne National Laboratory
- Searched LHC data for rare dark matter interactions; built an automated analysis framework

Amazon Web Services, Fundamental AI Research New York, NY — September 2025 – December 2025
Applied Scientist Intern

- Studied whether reflective prompt optimizers (GEPA, MIPROv2, APE) improve LLM reasoning or only elicit formatting and memorized facts
- Built a repeated-run statistical evaluation (paired t-tests, Mann–Whitney U, McNemar's) across GPT-OSS, Claude Sonnet and Qwen3 on AIME, BigBench Extra Hard and HotpotQA
- Showed that on BigBench Extra Hard, 16 of 24 tasks did not improve; of those that did, nearly all gains vanished under substring matching or came from memorized context (movie lists, capital cities), with one task (4%) showing a reasoning gain

- Ablating the memorized context returned accuracy to the formatting-only baseline
- Stratifying math data by problem type did not help (0 of 272 GEPA prompts improved); heterogeneous task mixes degraded performance

University of Washington Particle Physics Group Seattle, WA June 2020 – July 2022
Research Assistant
- Applied state-of-the-art machine learning models to particle jet classification, reaching 99% accuracy
- Ranked input-feature importance for jet classification by pruning features on benchmark datasets
- Built autoencoder and GAN models to detect anomalous events at the LHC trigger
- Quantized recursive and recurrent neural networks for FPGA deployment with hls4ml

Pacific Northwest National Laboratory Richland, WA July 2021 – September 2021
Machine Learning Research Intern
- Built few-shot models in PyTorch to predict the solubility of materials
- Analyzed model errors by molecule type and related them to the underlying chemistry
- Cut the input features by 30% with no loss in accuracy, using Spearman correlation to rank feature importance

University of Washington Quantum Materials Lab Seattle, WA March 2019 – July 2022
Research Assistant
- Grew quantum material crystals by flux, vapor and Bridgman methods, including multiple dopings of MnBiTe and $PdTe_2$
- Measured resistivity versus temperature on prepared samples
- Designed and refined growth recipes for new materials with graduate students

IRIS-HEP New York, NY January 2021 – June 2022
Research Fellow
- Extended the Reproducible Open Benchmarks (ROB) platform to run Jupyter notebooks, using papermill
- Built demos introducing ROB to the particle physics community
- Worked with New York University computer science and physics faculty

Washington Nanofabrication Facility Seattle, WA June 2019 – September 2019
Summer Research Fellow
- Fabricated cantilevers in a clean room, designing etch depths and masking layers and verifying them experimentally
- Used the cantilevers to measure fundamental frequencies and study structural transitions in quantum materials

PROJECTS

Distilling Jet Taggers into Physics Equations github.com/aaronw5/jet-tagger-distillation
- Rewrote the latent representations of two jet taggers, JEDI-linear (FPGA-deployable) and Particle Transformer (ParT), as if-statements on jet physics quantities such as jet and subjet masses
- For JEDI-linear, the distilled formulas reproduce the network's decision on 94% of jets (64 particles per jet) with equal classification accuracy
- The same formulas explain 92% of each neuron's variance in the trained network versus 16% in an untrained copy

Interpretability Explorer for a Trigger-Level Jet Tagger github.com/aaronw5/jedi-linear-explorer
- Wrote every neuron of the quantized JEDI-linear tagger as an exact formula of its particle inputs (p_T, $\Delta\eta$, $\Delta\phi$) and matched each to a jet physics quantity
- Built an interactive explorer with sparse autoencoders, transcoders and decision trees distilled from the network, evaluated on 50,000 held-out jets

Machine Learning for Cryogenic Transistor Modeling github.com/aaronw5/Cryo-Transistor-ML
- Trained neural-network surrogates of transistor current–voltage curves to extract BSIM4 compact-model parameters for SkyWater 130 nm transistors at 77 K, validating every fit in circuit simulation (NGSpice)
- Lowered fitting error relative to the published parameters on all 18 test devices (combined relative RMS error 0.260 to 0.214)
- First-author paper at the Sim2Sci Workshop @ NeurIPS 2026

Talks and Teaching

Lecture and tutorial, "Transformers," Parts I and II, Machine Learning for Fundamental Physics (ML4FP) School 2026, Georgia Institute of Technology, Atlanta, GA — June 2026

Talk, "Efficient and Interpretable Transformers for Jet Tagging," Fermilab AI Seminar Series, Batavia, IL — March 2026

Talk, "Spatially Aware Linear Transformer (SAL-T) for Efficient Particle Jet Identification," ML4Jets 2025, California Institute of Technology, Pasadena, CA — August 2025

Talk, "Fast RNN Inference on an FPGA," APS Division of Particles and Fields Meeting (DPF21), virtual — July 2021

Talk, "Implementation of Jupyter Notebooks into the Reproducible Open Benchmarks for Data Analysis Platform (ROB)," APS DPF21, virtual — July 2021

Talk, "Implementation of Jupyter Notebooks into the Reproducible Open Benchmarks for Data Analysis Platform (ROB)," ML4Jets 2021, virtual — July 2021

Talk, "Jupyter Notebook Compatibility with ROB," IRIS-HEP Fellow Presentations, virtual — June 2021

Posters

"Patch Hierarchical Attention Transformer for Efficient Particle Jet Tagging," NeurIPS 2026 — December 2026

"On the Clock: Towards Punctual and Productive Time-Budgeted AI Agents," Resource-Aware Agentic AI Workshop @ NeurIPS 2026 — December 2026

"Surrogate Assisted Compact Model Extraction for Commercial CMOS Process Operating at Cryogenic Temperatures," Sim2Sci Workshop @ NeurIPS 2026 — December 2026

"Why Is Attention Sparse in Particle Transformer?," Machine Learning and the Physical Sciences (ML4PS) Workshop @ NeurIPS 2025 — December 2025

"Efficient Transformer Architectures for Jet Tagging," ACAT 2025, Hamburg, Germany — September 2025

"Efficient and Interpretable Transformers for Particle Physics," Fast Machine Learning for Science Conference 2025, ETH Zurich, Switzerland — September 2025

"Interpreting Transformers for Jet Tagging," Machine Learning and the Physical Sciences (ML4PS) Workshop @ NeurIPS 2024 — December 2024

"Interpreting and Accelerating Transformers for Jet Tagging" (with lightning talk), Fast Machine Learning for Science Conference 2024, Purdue University, West Lafayette, IN — October 2024

Technical Skills

LLM & ML Methods:	GRPO and RL post-training, RLHF, supervised fine-tuning, reward design, trajectory-level data augmentation, RoPE and architecture modification, hardware-aware neural architecture search, LLM agents and evaluation
ML Frameworks:	PyTorch, TensorFlow, Hugging Face, vLLM, SGLang, Megatron, verl, scikit-learn, NumPy, Pandas
Infrastructure:	AWS, multi-node GPU clusters, Docker, Kubernetes, distributed training, ROOT
Hardware ML:	Quantization-aware training (HGQ2, QKeras), hls4ml, da4ml, FPGA resource and latency estimation, Verilator
Programming:	Python, Bash, Julia, MATLAB, Mathematica, R, Java, LaTeX
Mathematics:	Probability theory, statistics, linear algebra, differential equations, multivariable calculus

Mentorship

Timothy Legge	Transformer interpretability; now Ph.D. Physics, UC San Diego	Jan 2025 – Sep 2026
Victor Limouzi	Attention-free transformers; M.S. Computer Science, Imperial College London	Feb 2025 – May 2026
Jacob Ortiz	Attention-free transformers; AI Builders Fellow, M.S. Data Science, UC Berkeley	Feb 2025 – May 2026
Trevin Lee	Mixture-of-experts particle transformers	Aug 2025 – Present
Haris Zia	Switch particle transformers	Aug 2025 – Present
